EXPERIENCE

Jaffa Hub, Kenya — *Founder*

June 2019 - PRESENT

I have not had a chance to work for any company so far, and therefore I decided to open a software engineering company.

EDUCATION

Taita Taveta University, Kenya — *IT*

September 2015 - April 2019

Received a degree in Bachelor of Science(Information Technology).

PROJECTS

Nadab — *Hotels & Restaurants*

Nadab is the most interesting app I have developed so far. It is an app that automates the services offered in a hotel. These services includes: keeping track of customers orders and bills in a hotel, keeping track of all transactions in a hotel daily, weekly, monthly and yearly. The mobile UI of this app is developed in Android, while its REST-API has been developed using my best programming language which is Node.js. There's the customers app, hotels app and the admin dashboard. Here are the links to this amazing project: [Nadab \(Customers app\)](#), [Nadab \(Hotels app\)](#), [Nadab \(Admin dashboard\)](#)

Deli — *Ecommerce*

Deli is an ecommerce shop developed in Nodejs. It operates just like any other ecommerce shop, where the seller can post his or her products and their respective prices, whereas sellers can buy these products. This project enhances the use of Mongoose, EJS, Express.js, JWT, error-handling, and user validation. Here is the link to this project: [Deli](#).

SKILLS

Node.js

NoSQL – MongoDB

Flutter

DESCRIPTION

I'm passionate about making sure that web apps, mobile apps and software I develop are emotive, aesthetically pleasing, clear, on-brand and usable – with a touch of mellow Smoothness

AWARDS

Google Africa Scholarship –
[Android Developer Course](#)

LANGUAGES

English, Kiswahili

CMS — *Content Management System*

CMS is a Content Management System developed on Node.js. This system allows bloggers to post blogs to their websites and also manage them.

This system uses MongoDB, Express.js, and Express-handlebars. Here is the link to this project: [CMS](#).

JS-DEV-ENV — *Javascript Development Environment*

JS-DEV-ENV is a starter kit for Node.js projects. This of course means that it is developed in Node.js. This project caters for topics like: Editor and Configuration, Package management and security, Development Web Server, Sharing work in progress, Automation, Transpiling, Bundling (Webpack), Sourcemap, Linting, Testing and Continuous Integration, Mocking, Production Build (Minification and Source maps), and Deployment. Here is the link to this project: [JS-DEV-ENV](#)
